## Overview

---

What is an uninterruptible power system (UPS)?

Uninterruptible power system (UPS) (1) An electrical system designed to provide instant, transient-free backup power during power failure or fault. Some UPSs also filter and/or regulate utility power (line conditioning). (2) A device whose sole purpose is to save your equipment, your data and your job. User replaceable.

How many ups are there?

Although there is a spectrum of design configurations, there are five principle UPS arrangements often referred to as; 'Capacity' (N), 'Isolated Redundant', 'Parallel Redundant' (N+1), 'Distributed Redundant' (N+N) and 'System plus System' (2N) or (2N+1).

Why do I need an ups?

Many UPS models continually condition incoming power as well. Preventing data loss and corruption. Without a UPS, devices that are subjected to a hard system shutdown can lose data completely or have it corrupted. In conjunction with power management software, a UPS can facilitate a graceful system shutdown.

What is a capacity UPS system?

A capacity or 'N' system is the most common type of UPS installation and the minimum requirement to provide power protection to the critical load. Also referred to as 'power parallel', It comprises a single standalone UPS module or a paralleled set of modules with a matched capacity to the critical load projection.
