How does an LCD inverter work?

In simple terms, an LCD inverter takes the direct current (DC) power from the device's battery or power supply and converts it into the alternating current (AC) power needed to light up the screen's backlight. This backlight is what allows you to see the images on the LCD panel. There are two main types of LCD backlights that use inverters:.

Why do LCD screens need an inverter?

Inverters are essential for an LCD screen as they convert DC (Direct Current) from the power supply to AC (Alternating Current), enabling the backlight to function. Without an inverter, the screen would remain dim and unusable because the backlight is what makes the display visible.
