# Can solar power generation be done without a combiner box

## Overview

---

Do I need a solar combiner box?

Combiner boxes are required when there are more than three solar strings that need to be connected to the inverter. When working with less than three solar strings, they can be connected directly to the inverter without additional devices. For small residential solar systems with one or two strings, a solar combiner box is not a strict requirement.

How many strings can a solar combiner box hold?

Solar combiner box manufacturers often make boxes that can accommodate 3 strings or more. In order to size the box correctly, determine the number of strings in your system, and use that to find the minimum box size. The box is also sized based on the string voltage and current levels.

How does a solar combiner box work?

The operation of a solar combiner box is straightforward but essential. Each string conductor lands on a fuse terminal and the output of the fused inputs are combined onto a single conductor that connects the box to the inverter. Here's the step-by-step process:

What are the different types of solar combiner boxes?

Most solar combiner boxes come in outdoor enclosures with minimum NEMA 3R rating, although NEMA 4 steel and NEMA 4X non-metallic enclosures are more common. These are the most common type, designed to combine multiple DC inputs from a solar array into a single output.
