Cooling method of solar power station generator set

Overview

To keep your power station cool in the sun, you need effective heat management systems like cooling towers, heat exchangers, and ventilation. What are the different cooling methods used in PV systems?

The following key findings for each cooling method are summarized based on previous research work. Active cooling of PV systems uses forced air, water, and nanofluids to extract heat from PV panels. Active air-cooling requires air ducts, blowers, or fans to lower the panel's temperature on the rear side.

How to cool PV modules?

This is the simplest way of cooling PV modules, so it is very popular. This method increases the energy efficiency and cost-effectiveness of the system with a limited investment. Passive cooling with air is the cheapest and simplest method of removing excess heat from PV panels. In such a solution, the PV modules are cooled by natural airflow.

How do you cool a solar panel?

Another common method that has been widely researched is water-spray cooling, where water is sprayed over the front side of PV panels. According to research, it can enhance efficiency by 3.9% and keep the temperature at 41 °C (Basem et al. 2024).

Can geothermal energy be used to cool a PV panel?

The water in this cooling system first cooled the PV panel. Then the shallow geothermal energy through the UBHE was used to cool the cooling water and maintain the cooling system's cooling capacity. Experimental results showed that the proposed solution allows a 14.3% improvement in efficiency.
