# **Does the power inverter come with a battery**

## Overview

---

An inverter with inbuilt battery is an all-in-one device combining both the inverter and a rechargeable battery within a single unit. Do inverters need batteries?

For most residential and small commercial setups, the traditional battery and power inverter combo is the preferred choice to ensure continuous power supply during blackouts. So, while some inverter types do not require batteries, if your priority is uninterrupted backup power, investing in a quality battery in inverter system is essential.

What kind of batteries do inverters use?

Its modular and stackable battery packs provide the storage alone but are "inverter agnostic," which is the industry's way of saying they work with anyone. Its most popular battery is the 3.8 kWh battery module, which can be stacked and nestled next to your inverter on the wall next to your electrical panel.

Do inverters and batteries need to match?

The inverter and batteries must match in terms of voltage, capacity, and power output. If you are using a 12V battery, then the input voltage of the inverter must match the battery voltage. If the specifications of the battery and the inverter do not match, the system will not operate stably and may even damage the equipment.

Does a solar inverter work with a battery?

When incorporating a battery, the inverter must manage energy from both the panels and the battery storage. Not all inverters are equipped to handle this dual function. An inverter converts DC electricity from solar panels into AC power.
