**Energy storage bidirectional
inverter can charge and
discharge at the same time**

Overview

Are bidirectional power conversion blocks a solution to energy storage challenges?

A potential solution to these challenges is bidirectional functionality for AC/DC, DC/AC and DC/DC power-conversion stages. To further increase system integration, system BOM and form-factor reductions, the landscape of grid systems that involve energy storage is moving toward bidirectional power conversion blocks like those shown in Figure 2.

What is AC-coupled PV & energy storage?

In an AC-Coupled PV and energy storage solution (pictured in Figure 1, left side), both inverters employed can push power and can absorb or supply reactive power at the same time. The AC-Coupled system can produce peak PV power at the same time as the bi-directional inverter is discharging the full battery power to the grid.

What are bidirectional power conversion blocks & Hybrid inverters?

Bidirectional power conversion blocks and hybrid inverter solutions allow for reduced components, fewer modules and subsystems, and ultimately a lower system BOM cost. C2000™ devices for real-time control are purpose-built to meet designers' needs and help continue the growth of the energy storage market.

What is a hybrid inverter?

A hybrid inverter complements a solar inverter system with energy storage so that the same inverter can invert DC power from either the solar photovoltaic (PV) panels or the charged battery. In fact, this is one way solar PV manufacturers are using energy storage to grow their business and stay ahead of the market.
