## Overview

---

Why do we need a grid-scale energy-storage system?

Under some conditions, excess renewable energy is produced and, without storage, is curtailed 2, 3; under others, demand is greater than generation from renewables. Grid-scale energy-storage (GSES) systems are therefore needed to store excess renewable energy to be released on demand, when power generation is insufficient 4.

Are energy storage systems a good investment?

As the installed capacity of renewable energy continues to grow, energy storage systems (ESSs) play a vital role in integrating intermittent energy sources and maintaining grid stability and reliability. However, individual ESS technologies face inherent limitations in energy and power density, response time, round-trip efficiency, and lifespan.

What are energy storage systems?

As a power reserve technology, energy storage systems (ESSs) offer flexible charging and discharging capabilities, playing a crucial role in reserve provision, response, and time-shifting for renewable energy integration .

Are battery energy-storage technologies necessary for grid-scale energy storage?

The rise in renewable energy utilization is increasing demand for battery energy-storage technologies (BESTs). BESTs based on lithium-ion batteries are being developed and deployed. However, this technology alone does not meet all the requirements for grid-scale energy storage.
