# High frequency inverter output has noise

## Overview

---

Do switching power supplies cause inverter noise?

In switching power supplies, the capacitors in the clamp circuits with the largest voltage excursions are most likely to generate inverter noise. Usually in order to suppress electromagnetic interference and reduce device voltage stress, switching power supplies generally use RC, RCD and other absorption circuits.

Which components generate more inverter noise?

Therefore, these components will generate more inverter noise than capacitors with linear insulating components. In switching power supplies, the capacitors in the clamp circuits with the largest voltage excursions are most likely to generate inverter noise.

What causes high frequency noise in PWM inverters?

There are two main sources of high frequency noise generated by the PWM inverters. The first one is the PWM modulation frequency (2 ~ 20kHz). This component is mainly attenuated by the LC filter and the transformer.

What happens if an inverter is too loud?

It depends on the level of noise generated by the inverter itself. If the inverter is too loud, it can disturb the user's comfort, reduce efficiency, and accelerate components, as well as make other electronic devices around the inverter experience interference. How to remove inverter noise?
