

**BLINK SOLAR**

# **High transmittance double glass components**

## Overview

---

Which glass substrate has the highest transmission spectra?

The OTES-modified SiO<sub>2</sub> coating showed the highest transmission, around 94%, followed by the uncoated glass substrate with 91% transmission and the HS3 coating with a transmission of 87%. Fig. 4. Transmittance spectra of uncoated glass substrate, HS3 coating, and OTES modified SiO<sub>2</sub> coating on glass substrates.

What are the components of double glazing?

The double glazing presents the following assembly: 3.2 mm AR glass, 8 mm argon-filled gap, 3.2 mm low-e glass. The absorber consists of a copper tube-plate meander (plate thickness = 0.3 mm, tube spacing = 95 mm, tube diameter = 10 mm) and a selective coating ( $\alpha_e = 0.94 \pm 0.01$ ;  $\varepsilon = 0.05 \pm 0.02$ ).

Can double layer coating improve the optical properties of glass substrates?

The results demonstrate that the double layer coating is a promising solution for reducing reflection and improving the optical properties of glass substrates. This coating has potential value in various fields, particularly in the solar cell industry, where it can increase the efficiency and stability of solar cells.

What is double-layer AR hydrophobic coating on glass?

Double-layer AR hydrophobic coatings on glass combining a SiO<sub>2</sub>-TiO<sub>2</sub> coating as the bottom layer and OTES-modified SiO<sub>2</sub> coating as the upper layer were successfully prepared and characterized.

## High transmittance double glass components
