What happens when there are AC overvoltages in on grid inverters?

When there are AC overvoltages in on grid inverters, there are three situations: 01. The grid is too far away resulting in voltage rise. The distance between on grid inverter and on grid station is too far, which will lead to the increase of voltage difference at the AC terminal side of the inverters.

What is an on-grid inverter?

An on-grid inverter, also known as a grid-tie or grid-connected inverter, is a type of inverter used with on-grid solar systems. It works with the grid or government electricity. An on-grid solar inverter will continue to run your load and send power to the power grid when your solar system produces extra electricity. (read more. ).

What causes a solar inverter to fail?

The AC voltage overrange is the most common failure of the solar inverter connected with the PV grid system. This is because the grid voltage is not constant and it will change with the changing of the load and current. At the same time, the output voltage of the inverter will be affected by the grid voltage.

What happens if a solar inverter is connected in a wrong way?

If the AC wire of the solar inverter is connected in a wrong way, the AC voltage overrange failure may be caused. If the phase wire and zero wire are connected wrongly, then the inverter A phase will show that the line voltage is 380V and the B, C will show that the phase voltage is 220V.
