Make your own 12v to 380v inverter

Overview

How to build an inverter?

To clearly understand how to build an inverter, let's go through the following simple construction details: As per the circuit schematic first complete the assembly of the oscillator section consisting of the smaller parts and the IC. It is best done by interconnecting the component leads itself and soldering the joints.

How to design a 12VDC inverter circuit?

The aim of the inverter circuit is to convert 12VDC to 220VAC, Now to achieve this, we have to first convert 12VDC to 12VAC first followed by 12VAC to 220VAC using a step up transformer. In short, we can classify the designing of inverter circuit into three stages: 1) Driver stage 2) Power stage 3) Transformer.

How to amplify current in an inverter?

As the inverter output power is 600VA and it is 75% efficient so the input current at full load comes out to be 75Amp approx. (using ohm's law). Now this current amplification task is performed by the power stage. In this stage, two N-Mosfets are configured in push-pull topology to amplify the current.

How is a 3 phase inverter built?

The inverter is built using products included in the power electronics bundle. The guide focuses on implementing a 3 phase inverter with open-loop generation of sinusoidal currents in a resistive load. The topology of this inverter is shown in Fig. 1. It consists of three half-bridge modules, each connected to an inductor in series with a resistor.
