# Maximum charge and discharge time of flow battery

## Overview

---

How much discharge can a flow battery have?

Considering the distribution of volumes of typical flow batteries between volume in stacks and volume in tanks, then most often the potential volume for discharge is far less than 1%. Flow batteries may vary inside their own technology community but usually they work in ambient temperature ranges.

What determines the energy storage capacity of a flow battery?

Volume of electrolyte in external tanks determines energy storage capacity  
Flow batteries can be tailored for an particular application  
Very fast response times- < 1 msec  
Time to switch between full-power charge and full-power discharge  
Typically limited by controls and power electronics  
Potentially very long discharge times.

Can a flow battery be discharged without damaging the cell structure?

In flow batteries, high depth of discharge is possible which means most of its nominal capacity can be discharged without imposing any permanent damage to the cell structure. In addition, they can store electroactive materials required for battery operation in a tank outside the battery structure.

Are flow batteries feasible for large energy storage?

Yes, because of the long lifetime and because the active material can be easily recycled. In the view of experts, flow batteries are feasible for large energy storages. This can be interpreted in two ways. One is the storage of large amounts of energy and the other is to be able to discharge the nominal energy for a longer time period.
