How does a microcontroller-based Li-ion battery charger work?

This paper presents the design and implementation of a microcontroller-based Li-ion battery charger that employs real-time monitoring, adaptive charging strategies, and built-in safety mechanisms. The system integrates a CC/CV charging approach with automatic current regulation, overcharge protection, and reverse polarity detection.

Do lithium ion batteries need a precise charging procedure?

Research in the field of lithium-ion battery charging has established that Li-ion (3.7 V) and Li-polymer cells require a precise and controlled charging procedure to ensure safety and longevity.

How can we improve battery charging efficiency based on a real-time measurement?

Future work could focus on optimizing the charging process based on real-time measurements of internal battery resistance. By studying how resistance varies across battery age and condition, adaptive charging algorithms could be developed to dynamically adjust current and voltage for better efficiency and safety.
