# **Power wires for base station on roof**

## Overview

---

How far above a wall can a guy wire be installed?

Consistent, safe support of antenna installations over 10 feet above the uppermost wall bracket or roof mount depend on how well the guy wires are installed. The correct installation procedure is relatively simple. However, only the best quality materials and careful installation will provide sturdy, safe, long-lasting support.

What materials are needed for a guy wire installation?

The materials needed for a standard guy wire installation are: guy wires, guy ring (s), screw eye, and turnbuckles. Six-strand 18 or 20 gauge galvanized steel guy wire is recommended for general use (The 18 gauge wire is recommended for high-wind areas and installations over 20 ft. above the uppermost support.).

What is a guy wire installation angle?

It refers to the method of using guy wires to provide support and stability to structures like towers or poles. The best angle for guy wire installation typically falls between 30 and 45 degrees; this balance maximizes tension while minimizing stress on both the anchor points and the structure itself.

How many guy wires do you need for a telescoping mast?

Standard antenna masts (10 feet in height) require only one set of three guy wires. Telescoping masts generally require 4 guy wires for each 10 foot section. This will give the extra strength required for most installations. The guy wires are attached to the upper half of each mast section with a guy ring and clamp.
