Pumping out energy storage from solar power stations

Overview

Why do we need pumped storage power stations?

Hence, pumped storage power stations are required to adjust and store the surplus electricity generated during high-yield periods from these clean energy sources. The symbiotic relationship between clean energy power stations and pumped storage power stations fosters a robust and efficient multi-energy complementarity system.

Why are pumped storage power stations becoming more popular in China?

Driven by China's long-term energy transition strategies, the construction of large-scale clean energy power stations, such as wind, solar, and hydropower, is advancing rapidly. Consequently, as a green, low-carbon, and flexible storage power source, the adoption of pumped storage power stations is also rising significantly.

Can pumped storage power stations manage local grid load and power consumption?

This aspect primarily explores the capability of pumped storage power stations to exercise a vital regulatory role in managing local grid load and power consumption. Furthermore, within the scope of multi-energy complementarity, pumped storage power stations possess considerable regulatory potential for local wind and solar clean energy sources.

How can pumped storage and wind energy be used together?

Through partnering, wind energy can be used when abundant, while pumped storage balances supply when wind is low, reducing intermittency risks and maintaining stability. For instance, grid company investment in the Liaoning Qingyuan Pumped Storage Power Station enabled the rapid absorption and supply of electricity.
