Sea Cold Chain Container Generator

Overview

What is a genset generator?

What Is a Genset?

A genset, short for generator set, is a portable power unit that supplies electricity to refrigerated containers (reefers). These containers require a constant power source to maintain internal temperatures within the desired cold or frozen range.

What types of gensets do reefer containers use?

Operators typically choose between three types of gensets to power reefer containers, depending on how and where the container moves: underslung, clip-on, or on-chassis units. Each serves a specific role in cold chain operations. Underslung gensets mount beneath the chassis of the trailer or container-carrying vehicle.

What are the different types of gensets used in logistics?

There are typically two types of gensets used in logistics: Clip-On Gensets: Mounted directly onto the reefer container. Underslung Gensets: Attached beneath the chassis of the container trailer. These generators are most often diesel-powered, designed for durability, long run times, and operation in various climates.

How do gensets work?

They activate automatically when shore power is lost and keep the reefer container running throughout transfers, crane lifts, or waiting periods. Do gensets meet compliance requirements for pharma and food transport?

Modern gensets meet ISO 1496-2 and ATP standards and align with cold chain compliance frameworks for food and pharmaceuticals.
