How can a grid-connected inverter ensure system consistency?

In order to confirm system consistency, inverter should ensure that the desirable characteristics of both PV and grid are satisfied. This section outlines the standards and requirements for a grid-connected inverter system to ensure it meets the desirable characteristics of both the PV and grid.

How is a grid-connected inverter system simulated?

The test system is described shown in Fig. 13.6, the grid-connected inverter system is simulated using Matlab/Simulink. The simulation model mainly includes the main circuit module and the control module of a three-phase two-level inverter. The grid-connected inverter can distribute the active and reactive power according to the control.

What are the control objectives of grid-connected inverter?

The grid-connected inverter can distribute the active and reactive power according to the control. Therefore, the control objectives are designed as tracking active power and reactive power. The parameters of devices and circuits are shown in Table 13.1.

What are the parameters of a grid-connected inverter system?

Parameters of the grid-connected inverter system. The simulations of the steady-state operations are carried out when the MPC method is used. The given active power is 1000 W, and the given reactive power is 0 Var. The grid-connected currents are shown in Fig. 13.7A, and the spectrogram of the currents is shown in Fig. 13.7B.
