# **The first solar glass produced in Beirut**

## Overview

---

When were glass vessels discovered in Beirut?

Provided by the Springer Nature SharedIt content-sharing initiative Sixty-six glass vessels from excavations in Beirut and dated first century B.C.E. to the first century C.E. have been analysed by electron microprobe.

How much MNO does Beirut glass have?

For Beirut however, colourless glass mostly occurs in the range of 0.7–1.7% MnO but can have as little as 0.17% MnO. In the Beirut glass, weakly coloured glass occurs throughout this range (Fig. 3) but at Jalame, is mainly confined to MnO concentrations below 0.7%.

When was glass made?

By the middle of the first millennium B.C.E., raw glass was being manufactured from sand and natron in large primary tank furnaces located in the littoral regions of the eastern Mediterranean.

Where was Levantine glass made?

As anticipated, the data indicate that manganese-decolourised Levantine glass was worked and probably made in Beirut in the late Hellenistic period. Antimony-decolorised glass from Egypt is first detected in the second half of the first century C.E.
