The power consumption of the solar inverter itself

Overview

In terms of power consumption, the solar inverter itself uses a small amount of electricity. Typically, it uses less than 1% of the total energy produced by the solar panels. What is solar inverter efficiency?

Solar inverter efficiency determines how well an inverter converts the DC electricity created by solar panels to AC electricity that can be used in our homes and by the grid. Inverters are an integral part of any solar installation. Without them, our installations would actually be useless, since we couldn't use the electricity they produced.

How much power does an inverter consume?

In the datasheet of the inverter it is written that the consumption of the inverter is: $< 0.24\%$ of $P_{ac,r}$. I really don't know what is $P_{ac,r}$. I found $P_{ac,r}$ that is 55 kW but I don't think that an inverter has a consumption of 13200 W. Is it possible?

I allegated the screenshot of the part of the datasheet where it is written.

How much power does a 500W inverter use?

The inverter itself uses about 30W running a 500W load. There are some times that there is no load. Does the inverter still consume the same amount of power then?

Or significantly less because it is proportional to the load?

It's hard to tell since my usage watt meters are downstream after the inverter. Thanks in advance.

How much power does a 120V inverter use?

All inverters providing ready-to-use 120VAC have an idle consumption. There is a cost to running the circuitry that generates the 120VAC and 60Hz frequency. My 4kW Victron is about 30W as well.
