## Overview

What is a mobile base station?

A mobile base station, also called a base transceiver station (BTS), is a fixed radio transceiver in any mobile communication network or wide area network (WAN). The base station connects mobile devices to the network and routes them to other terminals in the network or to the core network of a mobile operator. Read more [Explore Mobile base](#).

What is a baseband unit (BBU)?

This integration improves performance in mobile networks and enables some of the following advances. The baseband unit (BBU) is a crucial component in mobile base stations, handling tasks like signal processing, resource allocation, and protocol management to ensure efficient communication between mobile devices and networks.

What is mobile communication?

Mobile communications is a form of cellular communication that requires a handset and a base station. A base station is a standalone wireless communication system and is used to communicate as part of a wireless telephone system such as GSM or CDMA cell sites.

What is a base station?

A base station (BS) is defined as a fixed communication facility that manages radio resources for one or more base transceiver stations (BTSs), facilitating radio channel setup, frequency hopping, and handoffs to maintain signal strength and connectivity for mobile devices.
