Overview

Does glass reduce air temperature?

Using a glass box with the size of 30 * 20 * 20 cm and taking normal glass as a benchmark, a ~5.4 °C air temperature reduction was observed in the summer outdoor demonstration and 37.4% annual energy-saving in tropical Singapore by simulation.

How does glass affect the HVAC system?

The amount of glass on a façade can impact the HVAC system and the project's ability to meet sustainability goals. The demand for highly glazed facades – think glass walls, floor-to-ceiling windows and large sliding glass doors – is here to stay for both designers and owners, and needs careful consideration in the design process.

Are large windows a problem in a cold climate?

In a cold climate, large windows can throw heating and cooling loads out of balance. We have faced this chicken-and-egg challenge with recent custom residential projects in rural locations. New Home in Stanford, NY, where deep roof overhangs and existing trees shade the house in summer, and high efficiency windows keep the cold out in winter.

Which window has the highest inner surface temperature?

Moreover, in cold environment thermal test, TET smart window gives the highest window inner surface temperature compared with normal, low-E and pure hydrogel glass. The observations in summer and winter thermal tests were further confirmed by energy-saving simulations in Cairo, Shanghai, Madrid, and Denver.
